Entrepreneurs like to talk about success. Failure, not so much. Indeed, when the terrible F-word is mentioned, it is almost always mentioned as something proud, a badge of honor. Perhaps this call for a new blog called My Startup has 30 days to live. Launched today by an anonymous CEO whose tech company quickly circled that leak, the blog is invigoratingly honest and should be more than a little scary for young, potential tech moguls. That's because if a blogger believes a startup has been killed not by tough rivals or a messy economy, but by a company accelerator, overly ambitious peers, and greedy venture capitalists - really, a startup culture itself. Here, for example, is what he calls his biggest mistake: We listened to our investors They were proven entrepreneurs who made millions (sometimes nefariously ...) and they believed in us. If we were only: Make feature X free Stop focusing on revenue, someone else would pay the bills to Grow \$VANITY-METRIC so you could show the hockey stick on demo day and look good Cut that pesky customer who generates 80% of your income, they're a distraction on the way to fulfilling \$OUR BIG-VISION We drank Kool-Aid and went va-a. By the time the demo day came around, we had checks being written and were all over the press. However, I had this nagging feeling eats on me. It's a nagging sense of disbelief. I didn't believe in the shit I was selling to investors. It wasn't the company I put my life on the line to build. Unsurprisingly, the blog sparked a lively conversation on Hacker News. Some commentators argue that the problem with the poster is that it intended to build a business rather than a startup. I have come to believe that if you are downloading, you have no business calling your company a startup. You build a small business, wrote a user called gregghinch. Adds another, michaelochuch. We say in this country that getting rich slowly is a virtue and that getting rich is a quick scam. However, VC is obsessed with the latter. The anonymous blogger - who finishes his inaugural post with a frightening final statement, I'm afraid - also gets his share of tips, the best of which I think comes from a Hacker News user tptacek: Your startup is going to die, you're going to get a new job (which you'll have no problem doing) and sometime in the future you'll start another company. Maybe you'll make the next one smarter since you'll have more experience. The signature, Been There, starting in February, the desert floor comes alive with flowers - which may seem strange to a place that is known as one of the driest in the world. This year is unique, however, because the valley received unusual rainfall in the fall and winter of last year. On my last visit in December, we experienced a shower one evening which is more rain than I personally saw in the Valley This unusual amount of precipitation may indicate one thing - desert in color Spring. Spring comes early to the valley, usually between early February and mid-April. But it is also ideal months to visit, as the temperature at this time is also mild. Several tour operators can drive to Death Valley and travel in February and March, offering everything from bus rides to hiking trips and adventures. Vince Fergus/© TripSavvy Country Pedestrians Explore the heights and depths of this arid valley with The Land of The Walkers, where you'll walk through the polished marble of Mosaic Canyon, explore the colorful mineral deposits of palette artists, go down from Dante's perspective and check out telescope peak for a four-day, three-night walking tour. Every day, plan on between two and five miles walk. The ideal time between late autumn and early spring is when the temperature in the valley is warm and mild. Austin Adventures Explore the irony of the largest park in the lower 48 states, Death Valley, with Austin Adventures. Expert guides will introduce guests to rolling sand dunes, glorious palettes, golden canyons and rocky volcanic remnants. Live in an oasis fueled by one of the largest and oldest aquifers in the state, located in one of the driest valleys in the world. The tour includes bike rides and jeep rides, backcountry exploration, hiking and more while you reside in the comfort of the historic Creek Inn oven. Globus Globus offers guests the opportunity to experience all the amazing sights on their tour of Southern California - such as Long Beach, Catalina Island and San Diego - as well as visit two of the state's most stunning national parks, Death Valley and Joshua Tree. Highlights of the trip include a star-studded observation in Death Valley, a jeep tour in Joshua Tree National Park, a visit to Ash Meadows - the largest remaining oasis in the Mojave Desert and home to nearly 30 species of plants and animals that don't exist anywhere else on earth - like the Galapagos Desert. In the Southern California area, guests can visit cabrillo National Monument, the Del Coronado Hotel in San Diego and take an air tram ride to Palm Springs. Smithsonian Travel Spend six days in Death Valley National Park with Smithsonian Travel. Highlights of the tour include Shoreline Butte, Badwater, Harmony Borax Works, Dante's View, sand dunes, off-road in Titus Canyon and a visit to Ubehabe Crater. You'll have the opportunity to experience the sunrise at zabriski Point, presentations from Smithsonian experts throughout the journey, hiking in the Golden Canyon, walking along Salt Creek and more. One of the best parts of the trip is a visit to the historic Amargos Opera House, the creation of dancer and artist Martha Beckett. Guests with the opportunity to watch a documentary about the Opera House in preparation for the visit and then visit it on the last day of the trip. The journey ends with a visit to the Ash Meadows National Wildlife Refuge way to Las Vegas, where the journey is complete. NOTE: Many Many also includes a visit to Scotty's Castle, but due to flooding in October 2015, the castle is currently closed and undergoing renovation. Thank you for letting us know! Over time, death was determined in many ways. Often we personify death, with visions ranging from the gruesome and gnarled Grim Reaper dashing handsome Brad Pitt to the 1998 film Meet Joe Black. In the first edition of the Encyclopedia Britannica, death was summarized as separation of body and soul, and this definition usually reflects how our views on death are related to our religious beliefs (or lack thereof). Fifteen editions later, the record was 30 times longer than Source: Kastenbaum. This increase in length is probably due to a deeper understanding of our human body. But from a purely biological point of view, death is not easier to define; indeed, medical advances and technology have only made it tougher to determine when a person is, in fact, dead. Not that detecting death without medical technology was a picnic, either. Imagine for a moment that you lived a few hundred years ago. You're at home with a family matriarch who seems to have died. You don't call for help from a doctor; rather, you would call a local priest to determine death. The family and the priest would have only outward signs that the man had died - they may have held a mirror in the woman's mouth or a pen over her nose to look for signs of breathing. If the mirror did not cloud or the pen did not move, then this person was as good as gone. In the 18th century, enough was known about the human body that you would have checked for a heartbeat, but it was still a few decades before the invention of the stethoscope. You may have done something known as the Balfour test, which means you would have stuck the needle through your skin into your heart. Then you would be watching at the top of the needle, which flags attached to see if there was movement. Advertising Over time, however, people realized that even if all the outward signs of life, like breathing and heartbeat, disappeared, there is still a chance that the person was not quite dead. In fact, fairy tales began circulating (with the help of one Edgar Allen Poe) that a man could be buried alive. Death was somehow, in some cases, reversible. Today we know that there is a technology that makes death completely reversible. If a person stops breathing, it can be connected to a ventilator that supports the respiratory and circulatory systems. We have feeding tubes, CPR and a range of devices that can keep a person alive if you measure life with a pulse. But doctors and family members began to think that perhaps the pulse wasn't quite enough to classify someone as alive. There were some patients who never regained consciousness after connecting to these machines. Doctors began to use terms such as a permanent vegetative state and an irreversible coma. In the French neurologists have described this condition as a coma depasse, or condition outside of a coma. These people didn't come back because their brains were too damaged. Around the same time, doctors discovered how to transplant organs into those close to death to prolong their lives. But there was one problem - they didn't have enough bodies to walk. Find out how these two situations collided to make a new definition of death on the next page.
